How Voltaris Creates and Captures Value

Voltaris Mobility N.V. • Amsterdam, Netherlands • Founded 2016

“Drive the Current.”

# How Voltaris Makes Money

Voltaris operates a hybrid business model that blends traditional vehicle manufacturing with recurring software and mobility-service revenue. The company sells cars, but it increasingly earns money from what happens after the sale — software upgrades, charging, and autonomous ride-hailing.

## Four Revenue Streams

The business rests on four distinct streams that reinforce one another:

- **Vehicle sales** — the core business: selling the Pulse, Vega, Aero, Atlas and Orion to private and fleet customers. This remains the largest share of revenue.
- **Software & autonomy subscriptions** — recurring revenue from Halo Pilot and Halo Autonomy upgrades, sold as one-time unlocks or monthly subscriptions and delivered over the air.
- **VoltGrid charging** — revenue from the company's 47,000-stall fast-charging network, used by both Voltaris owners and (increasingly) other brands' vehicles.
- **Voltaris Go mobility** — fare revenue from the autonomous robotaxi fleet built on the Helix vehicle, a fast-growing stream the company sees as central to its future.

## The Strategic Logic

Each vehicle sold is not just a one-time transaction but the start of a long-term relationship. Once a customer owns a Voltaris, they are likely to charge on VoltGrid, subscribe to autonomy features, and remain within the ecosystem for the life of the vehicle. The robotaxi business, meanwhile, lets Voltaris earn revenue from people who may never buy a car at all — expanding the company's addressable market well beyond vehicle ownership.

## Direct Sales & Retail

Voltaris sells directly to customers rather than through independent dealerships. Sales happen online and through 214 company-owned showrooms branded Voltaris Studios, typically located in premium urban retail districts. This direct model gives the company control over pricing, the customer relationship and the data that flows back into product development.

## Margins & Software Leverage

The software and services streams carry far higher margins than vehicle hardware. As the installed base of Voltaris vehicles grows, the company expects software, charging and mobility revenue to make up an increasing share of profit, improving overall margins even if hardware margins stay thin. This is the central financial bet of the business: hardware to build scale, software and services to drive profit.

## Cost Structure

The largest costs are battery cells and raw materials, vehicle assembly, and research and development — the last running at \$3.1 billion in FY2025, much of it directed at the Halo autonomy

system and the next generation of VoltCell batteries. Building the VoltGrid charging network is a major ongoing capital investment that the company views as a competitive moat.
