

Strategic Opportunities

Energy Transition, Oil Volatility & the Value of Electricity

Voltaris Mobility N.V. • Amsterdam, Netherlands • Founded 2016

“Drive the Current.”

Riding the Energy Transition

Voltaris operates at the centre of one of the largest structural shifts in the global economy: the move away from oil and toward electricity as the dominant energy source for transport. The company views this transition not merely as a regulatory tailwind but as the core opportunity defining its next decade.

Oil Volatility as a Tailwind

Petrol and diesel prices are exposed to geopolitical shocks, supply constraints and price volatility. Every spike in oil prices strengthens the economic case for switching to electric vehicles, whose running costs are both lower and far more stable. Periods of oil-price crisis have historically coincided with surges in EV interest, and Voltaris is positioned to capture that demand whenever fossil-fuel costs rise.

Electricity as a Strategic Asset

As transport electrifies, electricity becomes a strategic asset — and Voltaris is building a business around it. Through the VoltGrid network the company already sells energy directly to drivers. Looking forward, the large and growing fleet of Voltaris batteries represents an enormous distributed energy resource that can be coordinated with the electricity grid.

- **Charging revenue** — selling electricity through VoltGrid at scale, to Voltaris and other vehicles alike.
- **Vehicle-to-grid (V2G)** — parked vehicles can feed power back to the grid at peak times, turning batteries into grid assets.
- **Energy storage** — second-life Voltaris batteries can be repurposed as stationary storage once retired from vehicles.
- **Smart charging** — shifting charging to off-peak, low-cost, low-carbon hours benefits both customers and the grid.

Policy & Regulation

Governments across Voltaris' markets are setting timelines to phase out the sale of new combustion-engine vehicles, alongside incentives for EV purchase and charging infrastructure. These policies expand the company's market and, in some cases, directly subsidise the build-out of networks like VoltGrid. While policy can shift, the broad direction toward electrification is firmly established across the company's key regions.

Urban Mobility & Robotaxis

Beyond energy, the rise of autonomous robotaxis represents a second major opportunity. As cities seek to cut congestion and emissions, shared autonomous electric fleets like Voltaris Go offer a way to move more people with fewer, cleaner, better-utilised vehicles — opening a mobility-as-a-service market that did not previously exist.

Summary of Opportunities

Taken together, oil volatility pushes demand toward electric vehicles, electricity becomes a revenue stream and a grid asset in its own right, supportive policy expands the market, and autonomy opens an entirely new mobility business. Voltaris is built to benefit from all four at once.
